

PERSONAL WEB APPLICATION · FINAL PORTFOLIO

Firas Almashama

Assignment 4 · [Web Development](#) · 2026

A polished personal portfolio built with HTML, CSS, and JavaScript — no frameworks.

KFUPM

Software Engineering Student

[Live demo follows →](#)

What I Built & Why

A1

Structure

Semantic HTML, basic styling

A2

Interactivity

Filters, search, form, an API

A3

State & APIs

localStorage, GitHub data

A4

Polish

New sections + final shine

MY GOAL

Polish what I had — and add the sections that turn a class project into something I'd be proud to send to a recruiter.

Intentionally Simple

HTML5

Semantic, accessible structure

CSS3

Grid, Flexbox, custom properties

JavaScript

ES6+, async/await, fetch

GitHub API

Live repo data on every page load

localStorage

Theme, mood, visitor name persist

AI Tools

Claude / ChatGPT for review & debug

ZERO frameworks • **ZERO** build steps • **ZERO** npm packages

Live Walkthrough

Switching to the live site — here's what I'll show:

1

Theme & visitor greeting

Dark/light toggle, persisted name

3

Timeline

Journey from 2022 → next

5

Live GitHub feed

Repos fetched from the API on load

7

Mood Playground

Recolor the entire site in one click

2

Stat counters & Skills

Animated counters, skill bars filling in

4

Projects pipeline

Filter + search + sort, all chained

6

Blog & modal

Three posts, accessible reader

8

AI Chatbot

Ask it about the projects

Switching to the live site

(Alt+Tab to browser)

How the Mood System Works

Six color presets that recolor every gradient, button, bar, and dot in real time.

styles.css

```
:root { --accent: #7c5cff; --accent-2: #31d0aa; }  
[data-mood="sunset"] { --accent: #ff7e5f; }  
[data-mood="ocean"] { --accent: #0ea5e9; }  
[data-mood="forest"] { --accent: #16a34a; }
```

// script.js

```
document.documentElement.setAttribute("data-mood", mood);
```

~10 lines

of CSS define every preset

2 lines

of JS to apply + persist

Composable

Works with light/dark mode

Persistent

Saved via localStorage

The Chatbot — Honestly Fake, Genuinely Useful

1

User asks

Type or pick a chip

2

Score keywords

Whole-word regex match per topic

3

Best match wins

Highest score answers

4

Reply appears

After a fake typing delay

16

topics in the
knowledge base

~80

lines of
JavaScript

0

external API calls
(no key exposed)

100%

transparent —
no fake AI claims

What Worked & What Didn't

✓ RESOLVED

Stat counters re-running

Switched to IntersectionObserver + unobserve() after first hit

Theme + mood fighting

Separated into independent attributes on <html>

Modal accessibility

Escape, click-outside, focus management, body-scroll lock

→ NOT IMPLEMENTED / FUTURE

Real form delivery

Would need Formspree or a serverless endpoint

Real AI backend for chatbot

Would need a small proxy server with API key

Future: offline & i18n

Service worker, Arabic version, automated tests

Small Touches That Add Up

None are flashy on their own. Together they make the site feel polished.

Composable themes

Light/dark + 6 mood presets — independent attributes

Offline chatbot

No API keys exposed in the browser

Reduced-motion respected

Typing loop & animations honor user preferences

Eased counters

`requestAnimationFrame` with ease-out cubic

Print stylesheet

Resume page strips chrome for clean PDFs

Inline SVG favicon

Skips an extra HTTP request

Thanks!

4 assignments

→ 1 portfolio I'm proud of

WHAT I'M WALKING AWAY WITH

- Confidence in vanilla JavaScript
- Hands-on practice with Fetch & external APIs
- Performance habits — debouncing, IntersectionObserver
- A workflow for using AI without losing my own skills
